

Breast Tomosynthesis

Latest technology
in breast radiology

- **3D** breast scan
- Detection of **40% more breast tumors**
- **Earlier** diagnosis

Smaller lesions

It distinguishes all the tissues of the breast and detects very small lesions that are imperceptible to a conventional mammography machine

Greater specificity

In dense breasts, it allows distinguishing benign and malignant tissues with greater specificity, avoiding subsequent biopsies

Less false positives

Three-dimensional reconstruction of the breast clearly and precisely, substantially reducing false positives

Earlier diagnosis, allowing:

Detection of **smaller lesions**

Less aggressive treatments

Less invasive surgeries

Much lower aesthetic side effects
